

# Chapter 5

## Normalization of Database Tables

Database Systems:  
Design, Implementation, and Management,  
Seventh Edition, Rob and Coronel

## In this chapter, you will learn:

- What normalization is and what role it plays in the database design process
- About the normal forms 1NF, 2NF, 3NF, BCNF, and 4NF
- How normal forms can be transformed from lower normal forms to higher normal forms
- That normalization and ER modeling are used concurrently to produce a good database design
- That some situations require denormalization to generate information efficiently

# Database Tables and Normalization

- Normalization
  - Process for evaluating and correcting table structures to minimize data redundancies
    - Reduces data anomalies
  - Works through a series of stages called normal forms:
    - First normal form (1NF)
    - Second normal form (2NF)
    - Third normal form (3NF)

# Database Tables and Normalization (continued)

- Normalization (continued)
  - 2NF is better than 1NF; 3NF is better than 2NF
  - For most business database design purposes, 3NF is as high as we need to go in normalization process
  - Highest level of normalization is not always most desirable

## The Need for Normalization

- Example: Company that manages building projects
  - Charges its clients by billing hours spent on each contract
  - Hourly billing rate is dependent on employee's position
  - Periodically, report is generated that contains information displayed in Table 5.1

# The Need for Normalization (continued)

TABLE 5.1 A Sample Report Layout

PROJ. NUM.	PROJECT NAME	EMPLOYEE NUMBER	EMPLOYEE NAME	JOB CLASS.	CHG/ HOUR	HOURS BILLED	TOTAL CHARGE

## The Need for Normalization (continued)

- Structure of data set in Figure 5.1 does not handle data very well
- The table structure appears to work; report generated with ease
- Unfortunately, report may yield different results depending on what data anomaly has occurred

# The Normalization Process

- Each table represents a single subject
- No data item will be unnecessarily stored in more than one table
- All attributes in a table are dependent on the primary key

# The Normalization Process (continued)

TABLE  
5.2

## Normal Forms

NORMAL FORM	CHARACTERISTIC	SECTION
First normal form (1NF)	Table format; no repeating groups and PK identified	5.3.1
Second normal form (2NF)	1NF and no partial dependencies	5.3.2
Third normal form (3NF)	2NF and no transitive dependencies	5.3.3
Boyce-Codd normal form (BCNF)	Every determinant is a candidate key (special case of 3NF)	5.6.1
Fourth normal form (4NF)	3NF and no independent multivalued dependencies	5.6.2

## Conversion to First Normal Form

- Repeating group
  - Derives its name from the fact that a group of multiple entries of same type can exist for any single key attribute occurrence
- Relational table must not contain repeating groups
- Normalizing table structure will reduce data redundancies
- Normalization is three-step procedure

## Conversion to First Normal Form (continued)

- Step 1: Eliminate the Repeating Groups
  - Present data in tabular format, where each cell has single value and there are no repeating groups
  - Eliminate repeating groups, eliminate nulls by making sure that each repeating group attribute contains an appropriate data value

# Conversion to First Normal Form (continued)

**FIGURE 5.2** A table in first normal form

	25	Starflight	107	Maria D. Alonzo	Programmer	\$35.75	24.6
	25	Starflight	115	Travis B. Bawangi	Systems Analyst	\$96.75	45.8
	25	Starflight	101	John G. News *	Database Designer	\$105.00	56.3
	25	Starflight	114	Annelise Jones	Applications Designer	\$48.10	33.1
	25	Starflight	108	Ralph B. Washington	Systems Analyst	\$96.75	23.6
	25	Starflight	118	James J. Frommer	General Support	\$18.36	30.5
	25	Starflight	112	Darlene M. Smithson	DSS Analyst	\$45.95	41.4

## Conversion to First Normal Form (continued)

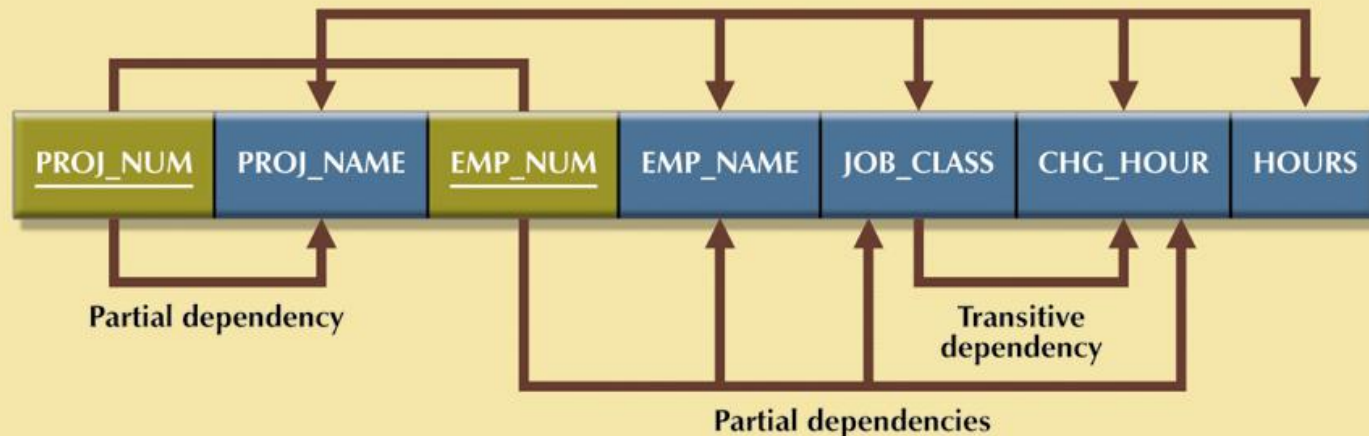

- Step 2: Identify the Primary Key
  - Primary key must uniquely identify attribute value
  - New key must be composed

## Conversion to First Normal Form (continued)

- Step 3: Identify All Dependencies
  - Dependencies can be depicted with help of a diagram
  - Dependency diagram:
    - Depicts all dependencies found within given table structure
    - Helpful in getting bird's-eye view of all relationships among table's attributes
    - Makes it less likely that will overlook an important dependency

# Conversion to First Normal Form (continued)

**FIGURE 5.3** First normal form (1NF) dependency diagram

1NF (PROJ\_NUM, EMP\_NUM, PROJ\_NAME, EMP\_NAME, JOB\_CLASS, CHG\_HOURS, HOURS)

PARTIAL DEPENDENCIES:

(PROJ\_NUM  $\Rightarrow$  PROJ\_NAME)

(EMP\_NUM  $\Rightarrow$  EMP\_NAME, JOB\_CLASS, CHG\_HOUR)

TRANSITIVE DEPENDENCY:

(JOB CLASS  $\Rightarrow$  CHG\_HOUR)

# Conversion to First Normal Form (continued)

- First normal form describes tabular format in which:
  - All key attributes are defined
  - There are no repeating groups in the table
  - All attributes are dependent on primary key
- All relational tables satisfy 1NF requirements
- Some tables contain partial dependencies
  - Dependencies based on only part of the primary key
  - Sometimes used for performance reasons, but should be used with caution
  - Still subject to data redundancies

# Conversion to Second Normal Form

- Relational database design can be improved by converting the database into second normal form (2NF)
- Two steps

## Conversion to Second Normal Form (continued)

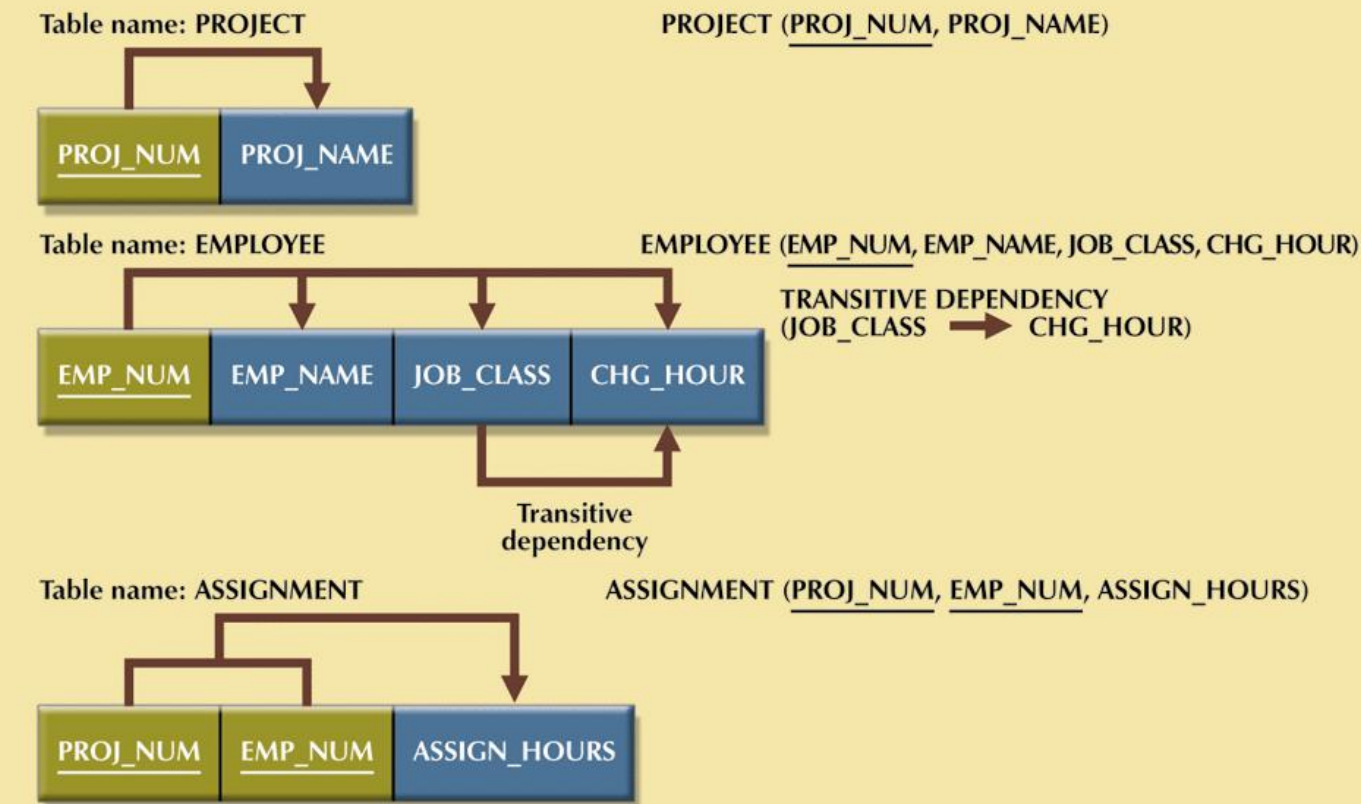

- Step 1: Write Each Key Component on a Separate Line
  - Write each key component on separate line, then write original (composite) key on last line
  - Each component will become key in new table

## Conversion to Second Normal Form (continued)

- Step 2: Assign Corresponding Dependent Attributes
  - Determine those attributes that are dependent on other attributes
  - At this point, most anomalies have been eliminated

# Conversion to Second Normal Form (continued)

FIGURE 5.4 Second normal form (2NF) conversion results

## Conversion to Second Normal Form (continued)

- Table is in second normal form (2NF) when:
  - It is in 1NF and
  - It includes no partial dependencies:
    - No attribute is dependent on only portion of primary key

## Conversion to Third Normal Form

- Data anomalies created are easily eliminated by completing three steps
- Step 1: Identify Each New Determinant
  - For every transitive dependency, write its determinant as PK for new table
    - Determinant
      - Any attribute whose value determines other values within a row

## Conversion to Third Normal Form (continued)

- Step 2: Identify the Dependent Attributes
  - Identify attributes dependent on each determinant identified in Step 1 and identify dependency
  - Name table to reflect its contents and function

## Conversion to Third Normal Form (continued)

- Step 3: Remove the Dependent Attributes from Transitive Dependencies
  - Eliminate all dependent attributes in transitive relationship(s) from each of the tables that have such a transitive relationship
  - Draw new dependency diagram to show all tables defined in Steps 1–3
  - Check new tables as well as tables modified in Step 3 to make sure that each table has determinant and that no table contains inappropriate dependencies

# Conversion to Third Normal Form (continued)

FIGURE  
5.5

Third normal form (3NF) conversion results

Table name: PROJECT

PROJECT (PROJ\_NUM, PROJ\_NAME)

Table name: JOB

JOB (JOB\_CLASS, CHG\_HOUR)

Table name: EMPLOYEE

EMPLOYEE (EMP\_NUM, EMP\_NAME, JOB\_CLASS)

Table name: ASSIGNMENT

ASSIGNMENT (PROJ\_NUM, EMP\_NUM, ASSIGN\_HOURS)

## Conversion to Third Normal Form (continued)

- A table is in third normal form (3NF) when both of the following are true:
  - It is in 2NF
  - It contains no transitive dependencies

## Improving the Design

- Table structures are cleaned up to eliminate troublesome initial partial and transitive dependencies
- Normalization cannot, by itself, be relied on to make good designs
- It is valuable because its use helps eliminate data redundancies

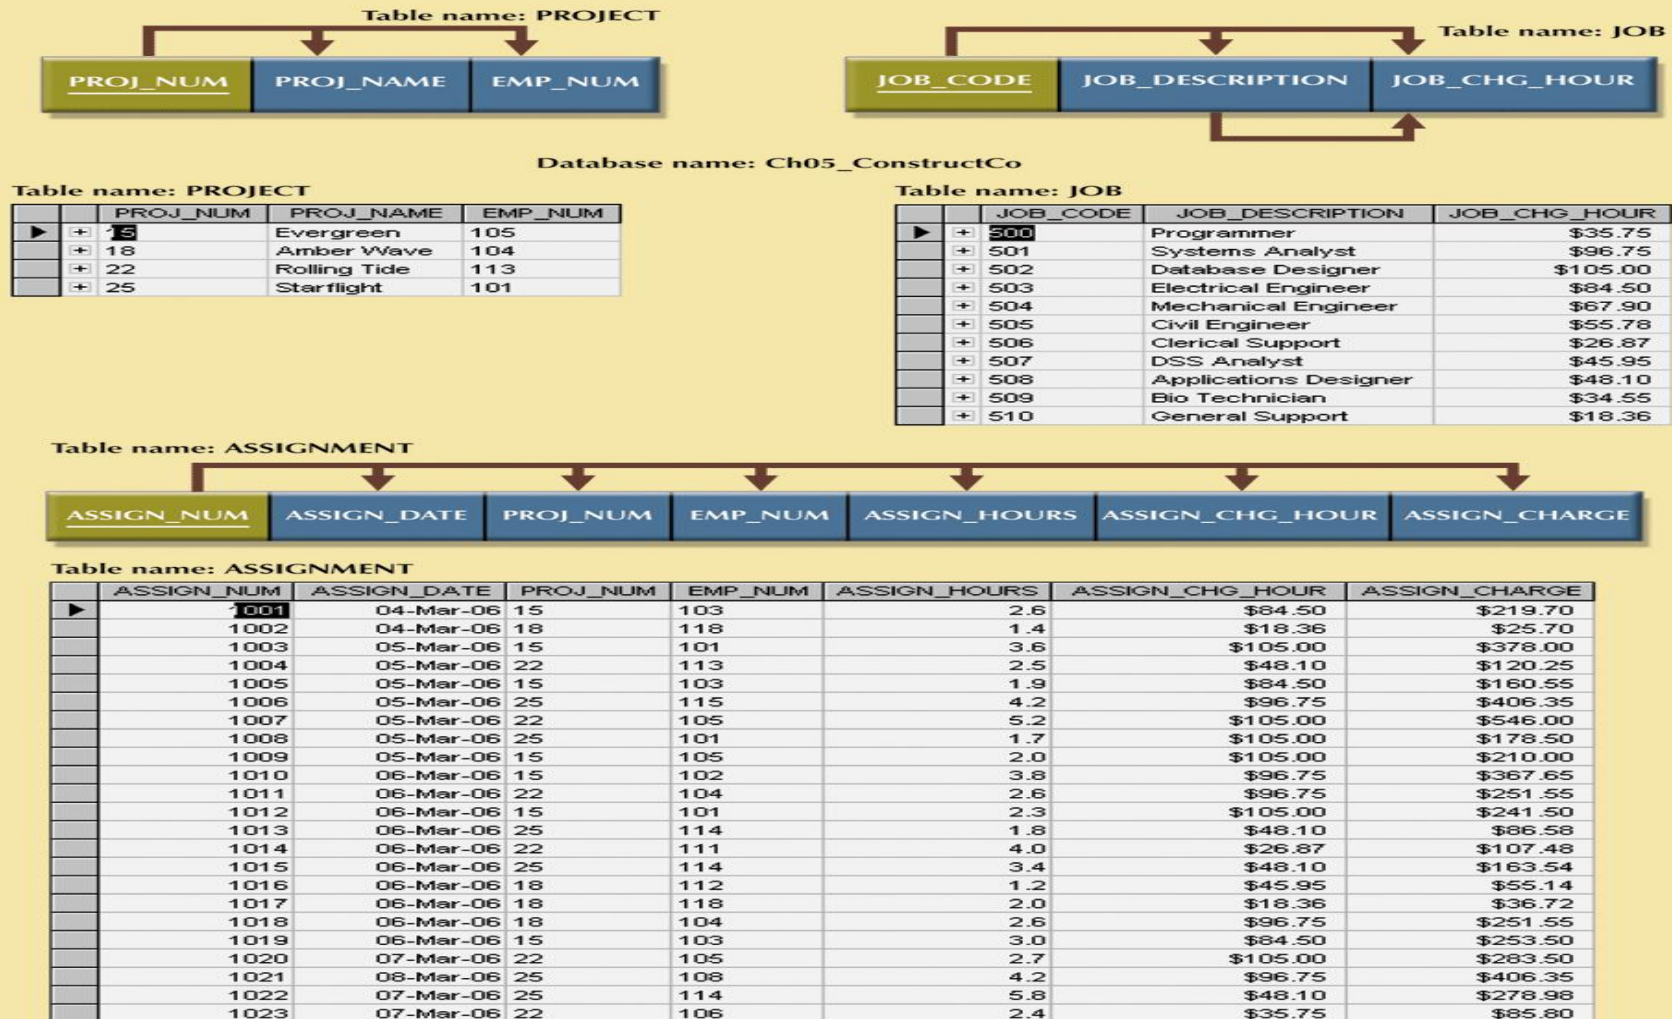

## Improving the Design (continued)

- Issues to address in order to produce a good normalized set of tables:
  - Evaluate PK Assignments
  - Evaluate Naming Conventions
  - Refine Attribute Atomicity
  - Identify New Attributes
  - Identify New Relationships
  - Refine Primary Keys as Required for Data Granularity
  - Maintain Historical Accuracy
  - Evaluate Using Derived Attributes

## Surrogate Key Considerations

- When primary key is considered to be unsuitable, designers use surrogate keys
- Data entries in Table 5.3 are inappropriate because they duplicate existing records
  - Yet there has been no violation of either entity integrity or referential integrity

# Surrogate Key Considerations (continued)

TABLE  
5.3

Duplicate Entries in the Job Table

JOB_CODE	JOB_DESCRIPTION	JOB_CHG_HOUR
511	Programmer	\$35.75
512	Programmer	\$35.75

## The Boyce-Codd Normal Form (BCNF)

- Every determinant in table is a candidate key
  - Has same characteristics as primary key, but for some reason, not chosen to be primary key
- When table contains only one candidate key, the 3NF and the BCNF are equivalent
- BCNF can be violated only when table contains more than one candidate key

# The Boyce-Codd Normal Form (BCNF) (continued)

- Most designers consider the BCNF as special case of 3NF
- Table is in 3NF when it is in 2NF and there are no transitive dependencies
- Table can be in 3NF and fails to meet BCNF
  - No partial dependencies, nor does it contain transitive dependencies
  - A nonkey attribute is the determinant of a key attribute

# The Boyce-Codd Normal Form (BCNF) (continued)

**FIGURE  
5.7**

A table that is in 3NF but not  
in BCNF

144	20	32456	B

# The Boyce-Codd Normal Form (BCNF) (continued)

FIGURE  
5.8

Decomposition to BCNF

## Fourth Normal Form (4NF)

- Table is in fourth normal form (4NF) when both of the following are true:
  - It is in 3NF
  - Has no multiple sets of multivalued dependencies
- 4NF is largely academic if tables conform to following two rules:
  - All attributes must be dependent on primary key, but independent of each other
  - No row contains two or more multivalued facts about an entity

# Fourth Normal Form (4NF) (continued)

The relational diagram

# Normalization and Database Design

- Normalization should be part of design process
- Make sure that proposed entities meet required normal form before table structures are created
- Many real-world databases have been improperly designed or burdened with anomalies if improperly modified during course of time
- You may be asked to redesign and modify existing databases

# Normalization and Database Design (continued)

- ER diagram
  - Provides big picture, or macro view, of an organization's data requirements and operations
  - Created through an iterative process
    - Identifying relevant entities, their attributes and their relationship
    - Use results to identify additional entities and attributes

# Normalization and Database Design (continued)

- Normalization procedures
  - Focus on characteristics of specific entities
  - Represents micro view of entities within ER diagram
- Difficult to separate normalization process from ER modeling process
- Two techniques should be used concurrently

# Normalization and Database Design (continued)

## Denormalization

- Creation of normalized relations is important database design goal
- Processing requirements should also be a goal
- If tables decomposed to conform to normalization requirements:
  - Number of database tables expands

## Denormalization (continued)

- Joining the larger number of tables takes additional input/output (I/O) operations and processing logic, thereby reducing system speed
- Conflicts between design efficiency, information requirements, and processing speed are often resolved through compromises that may include denormalization

## Denormalization (continued)

- Unnormalized tables in production database tend to suffer from these defects:
  - Data updates are less efficient because programs that read and update tables must deal with larger tables
  - Indexing is more cumbersome
  - Unnormalized tables yield no simple strategies for creating virtual tables known as views

## Denormalization (continued)

- Use denormalization cautiously
- Understand why—under some circumstances—unnormalized tables are better choice

## Summary

- Normalization is technique used to design tables in which data redundancies are minimized
- First three normal forms (1NF, 2NF, and 3NF) are most commonly encountered
- Table is in 1NF when all key attributes are defined and when all remaining attributes are dependent on primary key

## Summary (continued)

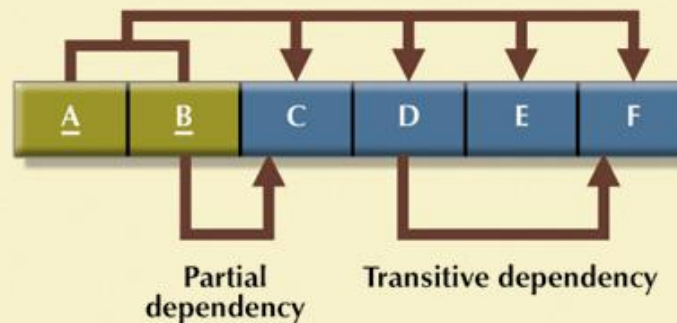

- Table is in 2NF when it is in 1NF and contains no partial dependencies
- Table is in 3NF when it is in 2NF and contains no transitive dependencies
- Table that is not in 3NF may be split into new tables until all of the tables meet 3NF requirements
- Normalization is important part—but only part—of design process

# Summary (continued)

FIGURE  
5.17

The initial 1NF structure

The Initial 1NF Structure

Step 1: Write each PK component on a separate line; then write the original (composite) PK on the last line.

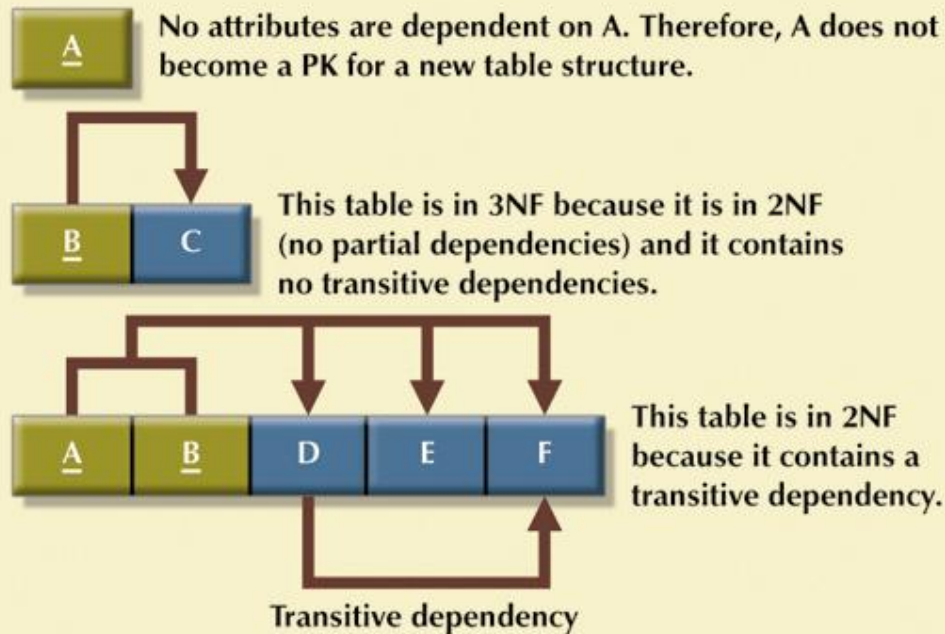

## Summary (continued)

**FIGURE  
5.18**

### Identifying possible PK attributes

**Step 2:** Place all dependent attributes with the PK attributes identified in Step 1.

## Summary (continued)

**FIGURE  
5.19**

Table structures based on the selected PKs

Step 3: Remove all transitive dependencies identified in Step 2  
and retain all 3NF structures.

All tables are in 3NF because they are in 2NF  
(no partial dependencies) and they do not contain  
transitive dependencies.

## Summary (continued)

- Table in 3NF may contain multivalued dependencies that produce either numerous null values or redundant data
- It may be necessary to convert 3NF table to fourth normal form (4NF) by
  - Splitting table to remove multivalued dependencies
- Tables are sometimes denormalized to yield less I/O which increases processing speed
